DEFINITIONS

Established Plan of Care: the plan of care for PCA will be considered established when the patient is comfortable when moving and sleeping and has progressed to q4h vital signs monitoring. The plan of care must be documented in the nursing care plan. If any change in setting or medication or increased frequency of monitoring is required, the plan of care is no longer considered established.

Patient Controlled Analgesia (PCA): is a method of pain control designed to allow the patient to administer pre-set doses of an analgesic, on demand (APS, 2003)

ROLES

Registered Nurses (RNs) – as assigned, RNs care autonomously for patients requiring PCA for pain management. RNs provide consultation and collaboration to others as needed as patient needs become more complex.

Graduate Nurses (GNs) – as assigned, GNs provide care, with direct supervision, for patients requiring PCA for pain management until deemed competent to practice autonomously.

Graduate Licensed Practical Nurses (GLPNs) - GLPNs identified by their manager, in targeted practice settings, will be certified in the LPN Additional Competency Patient Controlled Analgesia with an Established Plan of Care, and may provide care as assigned, for patients who are less complex, more predictable, and at lower risk for negative outcomes, with the direct supervision of an RN or certified LPN.
Licensed Practical Nurses (LPNs) - LPNs identified by their manager, in targeted practice settings, will be certified in the LPN Additional Competency “Patient Controlled Analgesia with an Established Plan of Care”, and may provide care autonomously, as assigned, for patients who are less complex, more predictable, and at lower risk for negative outcomes. If a change is required in the plan of care, the LPN will consult with a RN or physician, and work collaboratively to establish a new plan of care.

PREAMBLE

The Goals of Pain Management:

**Goal 1:** The PCA medication will not necessarily eliminate all pain, but allow sufficient pain relief to make the patient comfortable when moving and sleeping.

**Goal 2:** Minimize unpleasant side-effects related to opioid use (e.g. nausea, vomiting, pruritus, urinary retention, constipation, sedation, respiratory depression).

Goals of Patient/Family Education:
The patient or family will understand that although pain is expected after surgery, treatments will be used to manage pain so that the patient is comfortable at rest, during movement, and when asleep.

Discuss:
- The patient should NOT wait until he/she is suffering unbearably with pain before pressing the PCA button to receive more medication.
- “Putting up with the pain” will not speed recovery, and may instead interfere with healing.
- It is appropriate to use medication to manage pain – doing so as instructed is not associated with an increased risk of addiction.
- It may not be safe to completely eliminate all pain after surgery.
- Non-pharmacologic interventions may also be appropriate to use to reduce pain and medication requirements.
- Pain will be assessed regularly using a standardized tool. The purpose of pain assessment is to determine the appropriateness of treatment or whether further assessment is needed.

1. **PURPOSE**

1.1 To provide safe, optimal pain management.

1.2 To allow patients to participate in their own pain management.

2. **POLICY**

<table>
<thead>
<tr>
<th>Education required for LPN certification</th>
</tr>
</thead>
</table>
| The LPN certified in PCA with an Established Plan of Care will have first completed the following learning module/activities prior to caring for a patient with PCA:  
| - Attended an educational session on PCA,  
| - Completed the PCA Learning Package and quiz and returned to clinical nurse educator,  
| - Completed the skills checklist with an RN or certified LPN to validate and ensure that safety checks are followed appropriately.  
<p>|</p>
<table>
<thead>
<tr>
<th>Physician Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>At RUH the Anesthesiologist is responsible for selection of patients as</td>
</tr>
</tbody>
</table>
candidates for PCA and for all orders regarding PCA.
- At SPH & SCH the Most Responsible Physician (MRP) may select PCA candidates and write PCA orders.
- Anesthesiologist or MRP will complete the appropriate PCA order set. See Appendix A

<table>
<thead>
<tr>
<th>Responsible for initiation/loading dose</th>
<th>RN, GN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Responsible for maintenance and patient teaching</td>
<td>RN, GN, Certified LPN as assigned, once patient monitoring progressed to q4h</td>
</tr>
</tbody>
</table>
| **Modes of PCA Delivery** | Loading Dose – delivers a medication dose during set-up or at any time during PCA administration
- PCA mode – delivers a bolus medication dose only at the patient’s request provided the lock-out interval is not in effect and the 4 hour dose limit has not been exceeded. Dose is activated by the patient depressing the bolus button on the patient pendant.
- Continuous Mode – delivers at a pre-set continuous rate and does not allow the patient to request a PCA dose
- PCA and Continuous Mode – delivers at a pre-set continuous rate while allowing the patient access to the PCA mode. |
| **Tubing Change** | q 96 h |
| **Special Considerations** | Use PCA pump with DERS (Drug Error Reduction Software) if available.
- A continuous IV infusion is required for PCA administration.
- PCA can be administered through a peripheral IV or central venous catheter
- PCA tubing must be clamped prior to opening the pump door
- Loading dose shall be considered an IV push medication and administered according to Nursing Policy #1089 Intravenous – Push Administration
- PCA processes (e.g., programming, cartridge changes) are considered High Alert processes and must follow Regional Policy #7311-60-020 High Alert Medications – Identification, Double Check & Labeling
- Pump keys (to lock and unlock the pump) will be available and kept secure with the narcotics.
- PCA cartridges will be provided by Pharmacy.
- PCA cartridges requiring refrigerated storage will be kept in a locked fridge.
- Naloxone (Narcan®) and Resuscitation Equipment must be available on the Nursing Unit |
| **Monitoring** | Frequency:
- As per Order Set
  - On initiation of the PCA
  - With each change in setting or medication
  - The continued frequency of VS will be based on the patients’ clinical assessment. Minimum frequency of VS is q4h until PCA is discontinued
| Requirements: | Respiratory rate & quality, unstimulated
- Vital signs as per PCA Order Set |
Policies & Procedures: Patient Controlled Analgesia (PCA)

- Sedation and Pain Scale scores - see Appendix C
- Difficulty with voiding, nausea/vomiting, pruritus, and constipation.

### Documentation
- On PCA Standard Order form:
  - Initial programming and start time by 2 RNs or GNs currently competent in PCAs,
- On Medication Administration Record (MAR):
  - Cumulative total q4h
- Using the High Alert processes document
  - Programming changes
  - Cartridge changes
  - On transfer of care
- On Narcotic Administration Record (NAR)
  - Narcotic vial usage and wastage (after PCA is discontinued)
- Vital Sign monitoring on appropriate Vital Sign Record
  - Document vital signs at each assessment including pain and sedation scales
  - Document type of pain scale used in nursing notes or on care plan

### Reporting
- To Anaesthesiologist on call or SPH/SCH MRP:
  - For Adult Patients: see appropriate PCA Order Set (Appendix A)
  - For Pediatric Patients under 17 years: See Pediatric Order Set (Appendix B)

3. **PROCEDURE**

3.1 **Gather supplies**

- PCA set – Long with Injector, Mini-Bore (SKU#502035)
- PCA pump & key
- Preloaded narcotic cartridge as ordered

3.2 **Ensure patient and family teaching has been done. Whenever possible, patient teaching should be done pre-operatively, when the patient is alert. Include:**

3.2.1 **The use of the “button”**

- Not to press the button if pain is well controlled or if experiencing increased sedation.
- No one else is to press the button. Ensure family knows this as well.

3.2.2 **The pump will be programmed to “lock out” for a period of time after the dose is delivered.**

3.2.3 **The frequency of assessments including the pain scale and pain scale used.**

- Explain the purpose of assessing pain using standardized pain scales.
- Explain that the pain score provided by the patient will only be compared to other scores provided by that patient (within-person) to determine the effectiveness of treatment.

3.2.4 **The goal of pain management. (See Preamble)**
3.2.5 Instructions to notify the nurse if experiencing side effects including: increased difficulty breathing, increased sedation, itching, rash, nausea, difficulty voiding, and/or increased pain.

3.3 Attach preloaded narcotic cartridge to PCA set and prime PCA line either manually or with use of PCA prompts after inserted into pump.

3.4 Close upper slide clamp adjacent to PCA medication cartridge.

3.5 Attach IV infusion to luer lock port above back check valve on the PCA tubing. Prime primary line of PCA set with IV solution. 

**Note:** *a continuous IV infusion is required.*

3.6 Insert cartridge into PCA pump aligning bar code with bar-code reader. If the cartridge is a Pharmacy compounded cartridge, ensure the drug label is visible for verification.

3.7 Program PCA according to physician’s orders, performing independent double check, following High Alert Medication policy # 7311-60-020.

3.8 Connect PCA set to patient’s IV site at extension set or port nearest insertion site. Secure button within patient’s reach.

3.9 Open slide clamp and start PCA

3.10 Monitor and document according to the policy & PCA Order Set.

**Vitals/Monitoring**
- HR, Respiratory rate and quality (unstimulated), BP, SpO2 and Sedation and Pain Scale on PCA initiation, dose increase or dose decrease due to over sedation q15min x 4, q1h x 4 then q4h until discontinued
- High alert medication independent double-check at PCA initiation (see below) and pump setting or cartridge changes; high alert medication verification q shift and on transfer of care
- Notify the □ Anesthesiologist on-call OR □ MRP:
  - SBP less than _____ mmHg
  - HR less than _____ beats/minute
  - RR less than/equal to 10 breaths/minute
  - Pain scale at rest is greater than 4/10
  - Uncontrolled side effects
  - O2 saturation less than or equal to 92% despite O2 administration

**Pain Management**
- Whoever discontinues the PCA writes new pain management medication orders including adjuvant and side-effect management medications
- Orders written by a consultant service (e.g. Anesthesia) can be processed and followed until the MRP can document agreement/disagreement

**PCA Analgesia**
- □ Anesthesiologist OR □ MRP:
  - Orders changes to the PCA bolus dose, lockout period and/or continuous infusion and orders/approves all narcotics, non-opioid analgesics, NSAIDs and sedatives (benzodiazepines and zopiclone) while on PCA
  - May have acetaminophen ordered by MRP/Surgeon for fever

### Pain Management continued...

**Adjunct Therapy (to be discontinued when PCA discontinued)**

- **O₂:** ___ L/minute to keep SpO₂ greater than 92%
- **Acetaminophen:** ___ mg (650 mg or 975 mg) PO/PR QID × 48 hours then stop
- **Ibuprofen:** 400 mg PO QID × 48 hours then stop
- **Naproxen:** 600 mg PO q12h × 48 hours then stop

**Management of Pain Medication Side Effects (to be discontinued when PCA discontinued)**

**Respiratory Depression**

- If RR less than 10 breaths/minute:
  - Stimulate patient
  - Stop PCA infusion immediately, administer no further opioids and notify the Anesthesiologist on call or MRP (as per page 1 of the order set) and Respiratory Therapist STAT
  - Administer O₂ at 10 L/minute by simple mask

- If RR less than 8 breaths/minute:
  - As above plus:
    - Naloxone 0.1 mg IV STAT and assess response; may repeat q1-2min for a total of 3 doses
    - Report a Safety Concern if naloxone administered

**Nausea / Vomiting**

- Ondansetron 4 mg PO/IV q8h PRN
- If ondansetron ineffective, change to diphenhydramine 25-50 mg PO/IV q4h PRN (use lowest possible dose for effect for elderly/frail)

**Pruritus**

- Diphenhydramine 25-50 mg PO/IV q4h PRN (use lowest possible dose for effect for elderly/frail)

**Constipation**

- Monitor bowel function daily and if last BM more than 48 hours ago notify MRP

**Urinary Retention**

- Insert urinary catheter to straight drainage PRN and MRP to review within 24 hours

2. **Patient Monitoring** (Refer to Tri-Site PCA Policy 1053)
   a. Monitor / record RR, HR, O₂ saturation, sedation and comfort levels upon initiation, dose increase, or dose decrease due to over sedation:
      q15min x 4; q1h x 4; then q4h until PCA is discontinued.
   b. Maintain O₂ saturation greater than 92%
   c. Naloxone to be immediately available on the unit
   d. Urinary retention: Insert foley to straight drainage prn and review in 24 hours

3. **Emergency Procedures**
   a. Respiratory depression (if patient unarousable or RR less than 12)
      - Stop PCA and call anesthesia STAT
      - Administer O₂ at 10 liters per minute by facemask
      - Give Naloxone (0.005 – 0.01 mg/kg) ______ mg IV stat
      - May repeat Naloxone ______ mg q 5 minutes x 2 doses
      - (to be discontinued when PCA discontinued)

4. Contact SPEC (Mon. to Fri. days) or Anesthesia via Switchboard if:
   - 4 hour total dose limit is exceeded
   - Inadequate pain control
   - Nausea or pruritis not responding to treatment
   - Problems or concerns with PCA pump

Word Form #103194  05/12  Category: Orders
Use one of these self-report tools if possible
( Substitute alternate words like “hurt” or “soreness” if patient does not use the word “pain”)

**Numeric Rating Scale (NRS, 0-10 scale):** "Tell me how much pain you have right now using a number from 0 to 10, where 0 is no pain, and 10 is the most pain possible."

**Faces Pain Scale-Revised (FPS-R):** "These faces show how much something can hurt. This face [point to left-most face] shows no hurt. These faces show more and more hurt [point to each from left to right] up to this one. [Point to right-most face] It shows the most hurt possible. Point to the face that shows how much you hurt in your body right now."

**Verbal Descriptor Scale (VDS):** “How much soreness do you have right now: none, mild, moderate or severe?”

If patient is non-verbal, has dementia, or has communication barriers that prevent self-report, use behavioral assessment tool like the **PAINAD**.

### Behavioral Tool – PAINAD

<table>

### POSS Sedation Scale

<table>
<thead>
<tr>
<th>Level</th>
<th>Description</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>Sleep, easy to rouse</td>
<td>Acceptable; no action necessary.</td>
</tr>
<tr>
<td>1</td>
<td>Awake and alert</td>
<td>Acceptable; no action necessary.</td>
</tr>
<tr>
<td>2</td>
<td>Slightly drowsy, easily roused</td>
<td>Acceptable; no action necessary.</td>
</tr>
<tr>
<td>3</td>
<td>Frequently drowsy, arousable, drifts off to sleep during conversation.</td>
<td><strong>Unacceptable:</strong> monitor respiratory status and sedation level closely until sedation level is stable at less than 3 and respiratory status is satisfactory. Review orders set &amp; notify Anesthesiologist or MRP.</td>
</tr>
<tr>
<td>4</td>
<td>Somnolent, minimal or no response to verbal and physical stimulation</td>
<td><strong>Unacceptable:</strong> stop opioid; consider administering naloxone. If resp rate is less than 10 refer to order set. Notify Anesthesiology or MRP. Continuously monitor patient until stable or other orders obtained.</td>
</tr>
