

When we honestly ask ourselves
which persons in our lives
mean the most to us,
we often find it is those,
who, instead of giving much advice,
solutions or cures,
have chosen rather
to share our pain
and touch our wounds
with a gentle and tender hand.

The friend who can be silent with us
in a moment of despair or confusion,
who can stay with us
in an hour of grief and bereavement,
who can tolerate not knowing,
not curing, not healing,
and face with us the reality
of our powerlessness,
that is the friend who cares.

- Henri Nouwen

We're here to help

Support is available. If you need to speak with someone, please contact Palliative Care Services which includes bereavement support. For more information about **Palliative Care Services** and bereavement support services contact 655-5868.

Other sources of support include the following:

Spiritual Care Support

St. Paul's Hospital (306)655-5000
Humboldt and area (306)682-8139

Social Worker Support

Royal University Hospital (306)655-2579
St. Paul's Hospital (306)655-5519
Saskatoon City Hospital (306)655-8352

Palliative Care Support (306)655-5868

In rural areas

Contact your local hospital or health centre.

As death approaches, people often experience a decrease in appetite with little or no interest in food and drink. They may be unable to digest food or take fluids by mouth.

While a decrease in appetite and thirst is not painful and is an expected part of dying, it can sometimes be worrisome. People are often concerned about reduced calorie intake or the effects of dehydration. It is natural for families to want to continue providing nourishment at this time.

In specific situations, artificial hydration (such as intravenous fluids) can be beneficial. Generally, however, hydration does not improve comfort or prolong life.

In order to make the best decisions about hydration it is important that the patient, family and health care team work together. Your physician, Home and Community Care Nurse or hospice palliative care team can offer information and advice about the role of food and fluids and ways to handle decreasing intake.

Discussions about nutrition are important. As death approaches, people's needs and wishes can change, making it necessary to keep asking, "what is helpful for this person at this time?" There will be no single 'right answer' to this question, as it will always depend on the unique circumstances of each patient.

Helpful things to consider

- Decreasing food and fluid intake is a common, natural part of the dying process.
- Most dying people do not experience thirst or hunger as death approaches.
- Giving food and fluids by artificial means (e.g. intravenously) does not usually prolong life or improve its quality.
- Providing food and fluids by artificial means may, in fact, increase distressing symptoms such as shortness of breath, respiratory congestion, restlessness, nausea and vomiting.
- When people have difficulty swallowing, eating and drinking may put them at risk for choking.
- Artificial hydration does not provide nutrition.
- Artificial hydration does not usually prevent or improve thirst or relieve a dry mouth.
- Frequent mouth care can help relieve a dry mouth (See General tips for mouth care, at right.)

Providing care and comfort

General tips for mouth care:

- Keep lips moist with petroleum jelly, water-soluble gels, artificial saliva or unscented moisturizer.
- Use a moist cloth, soft toothbrush or plain mouth swab to wipe the mouth; avoid glycerin and lemon swabs, which can dry the mouth further.
- Mist the mouth with water, being careful not give too much.

When the person is still able to swallow safely:

- Give mouth care, as above.
- Let him or her decide on the amount of food and fluid wanted.
- Offer ice chips or popsicles.

When the person is no longer able to swallow:

- Continue mouth care, as above.
- Consider offering other kinds of support such as massage, skin care, music and conversation.
